

Strange Pro Race Steel Front Brake Kits

Strange Pro Race Front (4-Piston) Steel Brakes (Drag Racing Only)

Strange front brake kits offer a tremendous weight savings over OEM brake components. The entire 4-piston brake kit weighs **only 33.50 lbs.**- complete with bearings, hubs, rotors, pads, calipers, pads, etc. Strange Engineering's brake kits are unsurpassed in detail. One example of our unparalleled attention to detail is evident in our hub design. Each hub has one bolt circle. Instead of adding an additional bolt circle, we machine five large lightening holes to reduce rotating weight. The billet aluminum hub is further lightened by the scalloped hub design. We take the reduction of weight seriously- even by fully machining a billet aluminum hub cap. Obviously, it would be far less expensive for us to manufacture one universal hub; however, we feel that the extra effort is expected from customers who want a premium quality Drag Racing brake kit.

Each Front Kit Includes: Strange 4-piston Billet directional calipers, forged slotted steel rotors, scalloped aluminum hubs with Timken® bearings, seals, studs, soft pads, billet aluminum mounts and necessary mounting hardware.

The following pages list current applications (4-piston) and pricing

Strange 2-piston front brake kits are available for Strange Struts

Other 2-piston applications are available by special order
