TERMINOLOGY

Bump Also called , compression or jounce. When the shock is

traveling, with the spherical bearings getting closer. Measurement of minimum length is spherical

bearing center to center at the fully compressed position.

Rebound Also called droop or extension, when the shock is traveling

with the spherical bearings getting farther apart.

Measurement of full extension is when the spherical

bearings are farthest apart.

1. Shock Body The black hard anodized threaded portion of the shock

assembly.

2. Base Cap Also called body cap, located at the end of the shock body

with a spherical bearing installed.

3. Eye Mount Also called eyelet or rod end, this is the assembly at the

end of the piston rod.

4. Spring Seat A large nut that is threaded to hold and to adjust the spring

height.

spring seat fixed position.

6. Bump Also called compression adjuster or jounce adjuster, used

to adjust the compression forces.

Adjuster (blue)

7. Rebound

(red)

Adjuster

Also called Extension adjuster, used to adjust the rebound

forces.

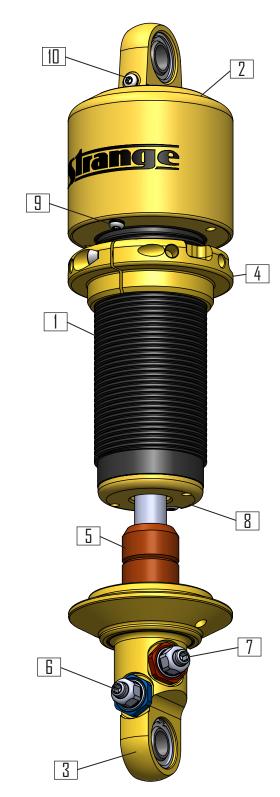

8. Rod Guide The area on the shock that the piston rod exits and goes

into the shock body, contains the seal and

piston rod bearing.

9. Gas Fill Screw The cover screw for the self sealing rubber valve.

10. Oil Fill Screw The screw that allows for adding oil to the shock

INTRODUCTION

Strange Engineering brings advanced shock technology into the Drag Racing market. As racers become more knowledgeable in chassis tuning, many are seeking qualities normally reserved for tier one vehicles used in other forms of motorsports. These double adjustable shocks address the internal events that normally occur during use, drastically reducing undesired changes in shock dampening.

- Monotube construction is lighter (and less unsprung weight) than a twin tube design.
- Dissipates heat more efficiently.
- The shock features a hollow shock rod, which has less inertia making it more responsive to changes in direction; In addition, the shaft is optimally hardened for increased strength, chromed, and super finished to provide superior life and reduce both deflection and friction.
- The ultra low friction guide and seal are self aligning that reduces low speed abrasion and wear that occurs during side loading and temperature changes.
- The large 48mm piston is manufactured from billet aluminum, hard anodized, and Teflon® coated.
- The larger piston area achieves higher dampening forces with lower internal pressures.
- A thin Teflon® coated piston band further reduces friction while allowing a straighter port design that minimizes changes in fluid direction.

The result is faster frequency response and lowered hysteresis, which permits a more progressive dampening force without the downside of additional lag that would normally accompany it. The extension and compression oil paths are completely sealed from each other eliminating any cross talk between them.

Distinguishing Features

Piggyback

- Easily converted to air adjustable
- Accepts longer springs
- Shorter dead length

Inline

- Shorter oil path for quicker compression response time
- More compact design (Internal Reservoir)

Inline Reservior

ADJUSTERS

In-Line Reservoir Double Adjustable

- The Compression and Rebound rotational adjusters are located on the Eye Mount at the end of the piston rod.
- Each adjuster has 25 positions and uses a 5/32nds hex wrench.
- The adjuster closest to the Eye Mount spherical bearing is the compression adjuster.
- The adjuster closest to the Rod Guide is the rebound adjuster.
- The detented clicks are referred to as 1 through 24.
- Rotating the 5/32nds hex adjuster clockwise will increase dampening force.
- Rotating the 5/32nds hex adjuster counter-clockwise will decrease dampening force. **WARNING:** Do not rotate the 3/4 inch nut anchoring the 5/32nds hex nut. This calibration nut is already set.

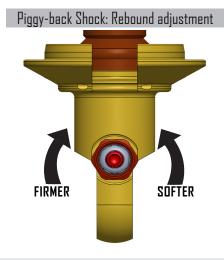

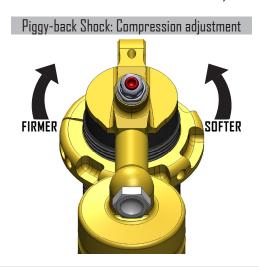

Integral (Piggyback) Reservoir Double Adjustable

- The Compression rotational adjuster is located on the End Cap on the Shock Body with the reservoir attached.
- The Rebound rotational adjuster is located on the Eye Mount at the end of the piston rod.
- Each adjuster has 25 positions and uses a 5/32nds hex wrench.
- The detented clicks are referred to as 1 through 24.
- Rotating the 5/32nds hex adjuster clockwise will increase dampening force.
- Rotating the 5/32nds hex adjuster counter-clockwise will decrease dampening force.

 WARNING: Do not rotate the 3/4inch nut anchoring the 5/32nds hex nut. This calibration nut is already set.

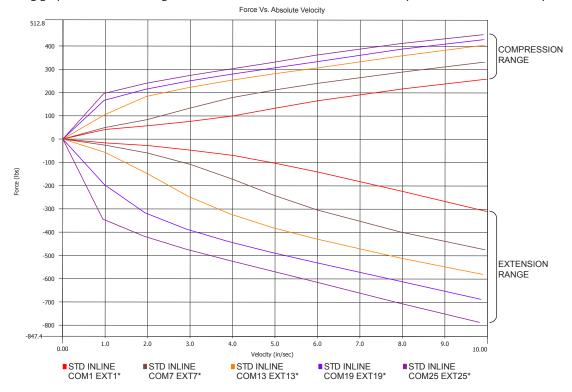

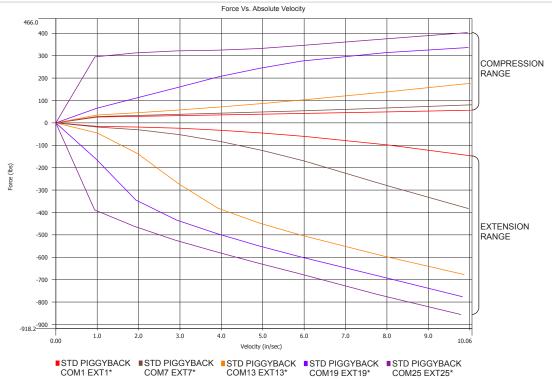

SHOCK DYNO GRAPHS

The following graphs show the average resistance of the shock extension and compression forces as velocity increases.

GAS CHARGE TOOL PROCEDURE

Thank you for purchasing the Strange Ultra Shock Gas Charging Tool. This tool is designed for gas charged shocks that use the self sealing rubber valves. We recommend using Nitrogen for gas charging the shocks. Nitrogen tanks and regulators are available at welding supply stores. This tool is designed to be threaded into a gas charging tool or used with a tire inflation chuck.

INSTRUCTIONS FOR USE:

- 1. Set your Nitrogen Tank regulator to 80 psi
- 2. Remove the gas filling screw on the Strange Ultra shock
- 3. Remove the cap from the schrader valve tool and the needle safety cap.
- **4.** If using a tire chuck for gas charging insert the gas charging tool into the rubber seal.
- **5.** If using a a gas schrader valve charger, thread the tool into the charger needle tool.
- **6.** Insert the needle into the rubber seal valve as straight as possible.
- 7. Pressurize the charging needle, shock must be fully extended during and after charge.
- **8.** Turn off pressure and pull the needle from the shock.
- **9.** Replace the filling screw on the shock and the protective safety cap on the needle.

Note: Check shock for pressure by compressing and releasing to watch shock extend.

WARNING: Wear eye protection, never point the needle towards yourself or others.

Item Number	Description	Quantity	Part Number
